

ABSTRACT OF THE DISCLOSURE

[076] Methods and apparatus for forwarding communications, such as telephone calls over a voice network, are provided. A user accesses a data network to specify one or more rules for forwarding telephone calls. For example, the user may use an electronic calendar to specify patterns for forwarding their telephone calls. These patterns may include one or more rules for determining a forwarding pattern, and one or more time periods specifying when the pattern is effective. The rules are provided to a service center which provides configuration information to the voice network. The voice network then forwards calls based on the configuration information for the time periods specified by the user.
